

# LAB Assignment #8 for ECE 525

## Description: ZeroTrust Light-Weight Authentication with FI (TTP\_DB.elf)

The overall setup for PUF-Cash is shown in the following figure:

FI: Financial Institution	AT: Authentication Token	MA <sub>LW</sub> : Light-weight Mutual Authentication
TI: Token Issuer (Central Bank)	HW: Heavy-weight (Timing DB)	SKG <sub>LW</sub> : Light-weight Session Key Generation
	LW: Light-weight (AT-based)	MA <sub>HW</sub> : Heavy-weight Mutual Authentication
		SKG <sub>HW</sub> : Heavy-weight Session Key Generation

In previous labs, we ran code that carried out heavy-weight (HW) authentication, which utilizes the timing databases stored at the Central Bank (also called the TI or token issuer), and light-weight authentication (LW) between Alice and Bob.

In this lab, we add the FI, and light-weight authentication between Alice or Bob and the financial institution (FI). The FI is also a device that possesses an instance of the SiRF PUF.

The FI maintains accounts for Alice and Bob, is multi-threaded and services requests from Alice and Bob for withdrawals and deposits.

The following describes the sequence of operations that occurs in TTP\_DB.elf, which the FI runs on the FPGA.

- Open socket to Bank and keep it open permanently.
- GenLLK(): Generate a long-lived key (LLK) with the TI, which the FI will use to generate AT.

if LLK exists  
 Regenerate LLK with SiRF

else  
 MA<sub>HW</sub>, SKG<sub>HW</sub> with TI  
 Get Chlng  
 Generate LLK with SiRF  
 Store Chlng info to LLK Table on device

PUF-Cash DB  
LLK Table

ID	AID	mask	Chlng	status

ID: chip #  
 AID: anonymous chip #  
 mask: Components of Chlng  
 Chlng: vectors, params, etc  
 status: 0: un-used, 1: used

- Request TTP-AUTHENTICATION with TI, do MA<sub>HW</sub>, SKG<sub>HW</sub>

- ZeroTrustGetCustomerATs()
  - if AT do NOT exist  
 ZeroTrust\_Enroll()

ZeroTrust\_Enroll()  
 If LLK non-null, ERROR  
 Get number of AT to generate from TI  
 For each AT  
 Generate nonce, n\_x  
 CH\_LLK = hash(LLK XOR n\_x)  
 encrypt(CH\_LLK) and send to TI  
 encrypt(n\_x) and send to TI  
 TI adds to ZeroTrustAuthenToken table

AuthenticationToken DB  
ZeroTrustAuthenToken Table

ID	CH_LLK	n_x	status

ID: chip #  
 AID: anonymous chip #  
 CH\_LLK: hash(LLK XOR n\_x)  
 n\_x: nonce  
 status: 0: un-used, 1: used

- GetClient\_IPs()
  - Get TTP IP from TI
  - Confirm that TI has same TTP IP

- GetCustomerChipNums()

TI sends encrypted chip\_nums (IDs) for all customers

FI decrypts list of chip\_nums

FI create an account record for each customer

FI deposits \$100 in each account

PUF-Cash DB  
PUF-Cash\_Account Table

ID	TID	Amount

ID: chip #  
TID: transaction id  
Deposit amount

- Create 20 threads and service requests from Alice and Bob

ALICE-WITHDRAWAL
